Lost & Found Item on Campus

Spring 26 COMPSCI 320

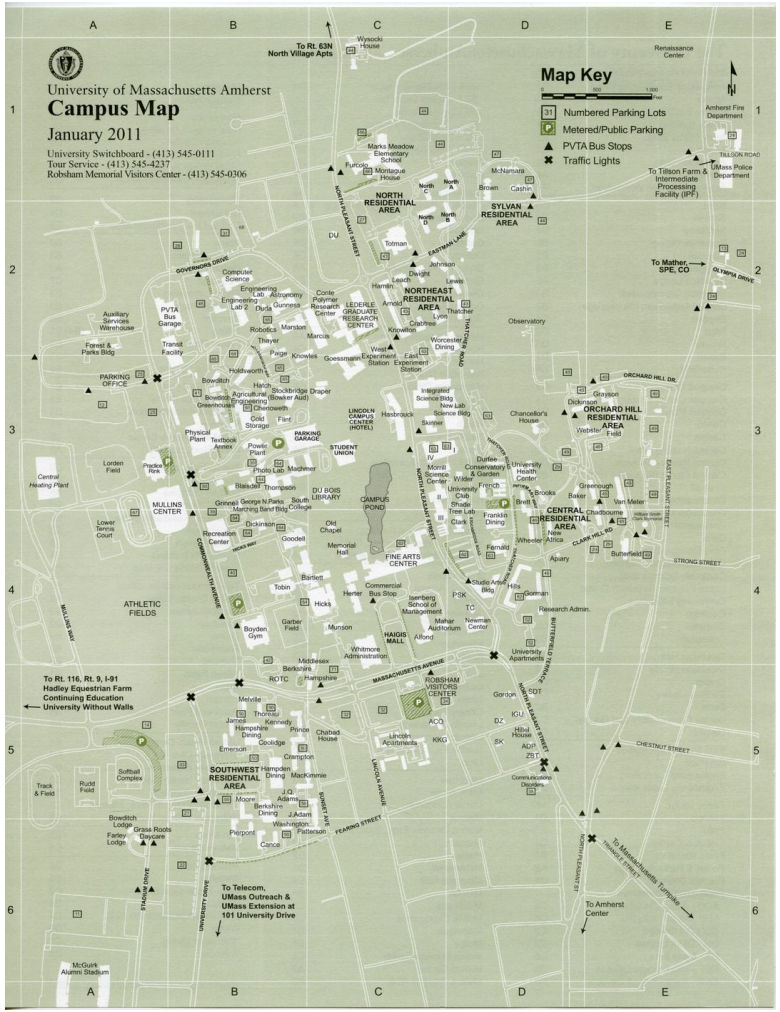
Group 3

Manager: Zainub Waqas

Members: Jenny Duong, James Pinkham, Saim Naushad, Sonya Ivkovic, Shraddha Venkatesh Sabbavarapu

Main Goal

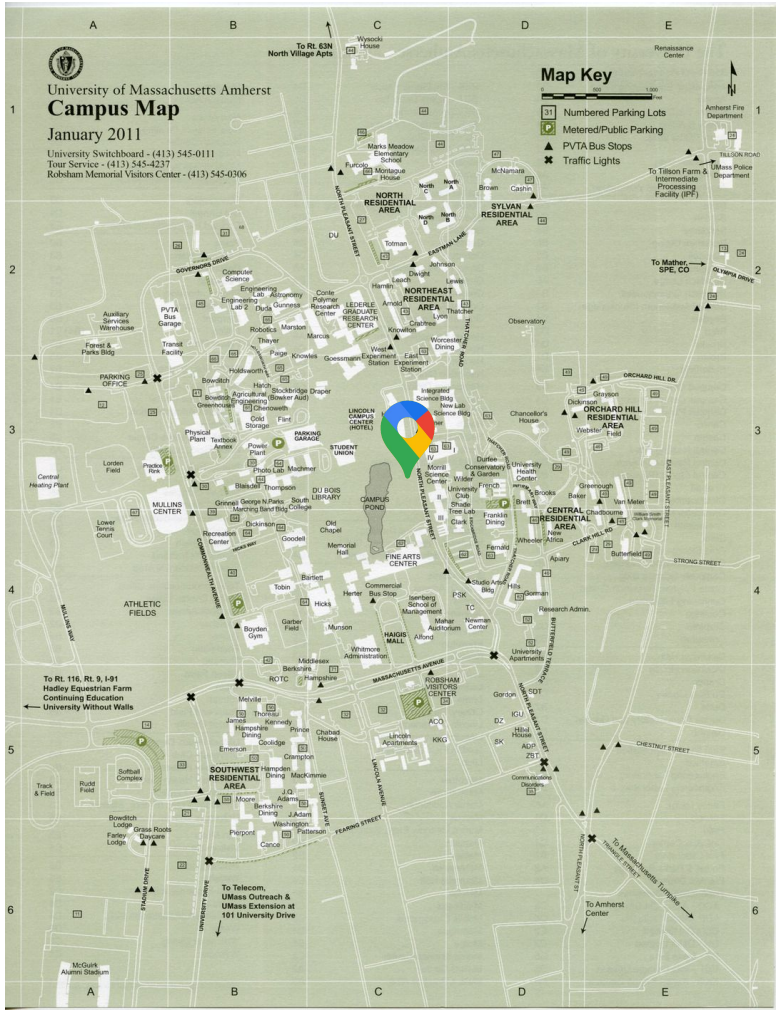
The goal of this application would be to help students easily report and locate lost or found items using an interactive campus map.



Main Goal

The application could allow users to:

- Drop pins on a campus map to report lost or found items
- Add item details such as category, description, date, and approximate location
- Filter and search items by category, location, or status (lost vs. found)
- View recent reports and updates in real time
- Mark items as returned or resolved



Informal: Report Item

A campus member finds or loses an item. The user goes on the app and selects whether they have found an item or lost an item. The user would then provide details of the item, such as **category, description, date, and approximate location**. The app records the information and confirms a report has been made.

Goal	Add item details such as category, description, date, and approx. location
Primary Actor	Campus member
Precondition	An item is lost or found The item is not recorded in the system
Success end condition	Item details are recorded and a confirmation is reported.
Failure end condition	Details not recorded into the system.
Secondary actors	System admin
Trigger	User wants to report a lost or found item
Main Success Scenario	1. User opens the app, logs into their account, selects report lost or report found 2. System prompts user to log item details 3. User enter details and submits 4. System validates input 5. System records item and confirms success
Variations (error scenarios)	1.a Invalid user input, system asks user to correct 1.b User does not have an account. System asks user to create account. 2. System error, system tells user ands retries to record 3. Item already in system
Variations (alt. scenarios)	2. User reports lost without pin, system prompts user to drop pin

Informal: Drop location pin

A campus member wants to log a lost or found item. As part of the report, they have **the option to drop a pin on a campus map** indicating the location of said item. Once the map loads, the system prompts the user to drop a pin. The **selected coordinates are saved and attached** to the report of the item. The user then proceeds with adding details.

Goal	Allow a campus member to mark the location of a lost or found item by dropping a pin on an interactive map.
Primary Actor	Campus member
Precondition	User has started the process for reporting a lost/found item. Map is displayed.
Success end condition	The specific coords marked by the user are saved and the process continues.
Failure end condition	Incorrect coords are saved, or correct location wasn't saved.
Secondary actors	System admin
Trigger	User wants to specify the location of a lost or found item in the report.
Main Success Scenario	1. System prompts user to log item details 2. System displays campus map and prompts to drop a pin for the item 3. User drags/taps on the map to drop a pin 4. System records the coordinates and saves for that item 5. User proceeds with report
Variations (error scenarios)	1. User places a pin outside the campus map 2. The user tries to proceed without dropping a pin 3. System error while trying to save the location
Variations (alt. scenarios)	2. User changes the pin after placing it the first time

Informal: Filter and search for items

If campus member wants to browse reported lost and found items more efficiently, they have the **option to filter items by a single criterion** such as **category, location, or status (lost vs. found).** The system updates the list to display only items that match the selected criterion. The user may later choose to apply additional filters or modify their selection to further refine the results.

Goal	Allow a campus member to filter and search lost and found items by category, location, or status.
Primary Actor	Campus member
Precondition	User is viewing the lost and found items list. Items exist in the system.
Success end condition	Items matching the selected filters/search criteria are displayed correctly.
Failure end condition	Items are not filtered correctly, or no results are shown despite matching items existing.
Secondary actors	System admin
Trigger	User wants to find specific lost or found items more quickly.
Main Success Scenario	1. System displays a list of lost and found items 2. System shows filter and search options (category, location, status) 3. User selects a single filter criterion 4. System applies the selected filter 5. System displays the filtered list of items
Variations (error scenarios)	1. No items match the selected filters 2. System fails to apply the filter 3. System error occurs while filtering results
Variations (alt. scenarios)	1. User changes or removes filters to view different results 2. User applies multiple filters at once

Informal: View recent reports and updates

If user wants to view recent reports for a list of lost and found item, they have the option to **filter the later/ oldest** item posted. Also, they can **update the information** of the items that they posted (like adding more information about the item if it's useful).

Goal	Allow use to view the latest/oldest post and updates the information where they last posted
Primary Actor	Campus member
Precondition	At least one lost or found item exists in the system. User has access to the application
Success end condition	Recent reports are displayed according to the selected sort/filter options The authorized updates are successfully saved
Failure end condition	Unable to update and save new information about the item Fail to load the latest/oldest report
Secondary actors	System admin
Trigger	User wants to check recent lost or found item reports or update an item they posted
Main Success Scenario	1. System updates the list based on the selected options (latest/oldest) 2. System displays item details and provides an option to edit the report 3. System validates and saves the updated information, then refreshes the item details
Variations (error scenarios)	1. System fails to load recent reports, then notifies the user to retry 2. System displays a “no results found” message 3. System error while saving updates
Variations (alt. scenarios)	User views the report list without applying any filters/ views item details but chooses not to update the item

Informal: Mark Items

A campus member views a previously reported lost or found item after it has been returned to its owner or otherwise resolved. The user selects the option to **mark the item as returned or resolved**. The system confirms the action and updates the item's status so it no longer appears as an active report.

Goal	Mark items as returned or resolved
Primary Actor	Campus member
Precondition	The item exists in the system and is currently marked as lost or found.
Success end condition	Item status is updated to returned or resolved and the report is closed.
Failure end condition	Item status remains unchanged.
Secondary actors	N/A
Trigger	User selects the option to mark an item as returned or resolved.

Main Success Scenario	1. User opens the application. 2. User views a reported lost or found item. 3. User selects “Mark as Returned” or “Mark as Resolved.” 4. System prompts the user to confirm the action. 5. User confirms the update. 6. System updates the item’s status. 7. System displays confirmation that the item is resolved.
Variations (error scenarios)	1. Item cannot be accessed. System displays an error message. 2. User cancels the confirmation. System makes no changes. 3. System fails to update the item. System notifies the user.
Variations (alt. scenarios)	1. User views the item details but chooses not to mark the item as resolved. 2. User navigates away from the item without making any changes. 3. User marks the item as resolved after reviewing additional item details.

Informal: Malicious App Use

A campus member decides to use the application with malicious intent. From all poor behavior: spamming reports to claiming items they have not collected or were not theres. Other campus members can report the bad actor on the application to system moderators. The system moderator will then review reports and take action as appropriate.

Goal	Prevent bad faith actors to ensure usability and safety
Primary Actor	Malicious campus member
Precondition	Campus member spams reports or repetitively collects item not belonging to them
Success end condition	System admin properly reviews reported application user and is dealt with properly
Failure end condition	Malicious campus members continues to use the app in a harmful manner
Secondary actors	Reporting campus member, system admin
Trigger	User is reported or system admin identifies bad acting user
Main Success Scenario	1. Malicious user opens the app, logs into their account 2. Malicious user spams reports, repetitively collects items that do not belong to them, marks reports resolved when they are not involved, etc. 3. Other campus member reports malicious campus member to system 4. System admin review report and deals appropriate consequences to bad actor
Variations (error scenarios)	3.a Report cannot be made successfully, prompts user to try again 3.b System admin does not notice unchecked malicious app behavior 4. System admin not diligent in reviewing reports
Variations (alt. scenarios)	3. System admin notices poor app behavior before it is reported

Any question?

Notes from Jaime

Dropping a pin

- If they don't know where they lost it, where do they drop the pin?
- Drop the pin in the approximate location/where you were when you last had it.
- Possible add a confidence score about it

What to do if you found an item?

- Leave it where it is/ or put it in the nearest lost and found box?

Could people just go pick up a lost item as a bad actor?

- This might be a secondary concern, there’s no preventing this necessarily

Preventing spam

- Might need to add user story for a reporting feature, system admin could review it.
- Post limit for a user in a certain amount of time?
- How do we prevent reporting duplicate items?

What happens once the report is resolved? Does the report disappear?
